Project #1: Design an OWL Ontology

This project is due on Thursday, March 28. It will count for 20% of your overall grade.

Working in five teams of three people each, you will design an OWL 2 DL ontology (or set of ontologies) for an application domain of your choice. Ideally, this domain should be something you know about. Since you are also expected to create a set of instances that demonstrate the use of your ontology, you should also choose a domain that has data you can access. Your team is encouraged to meet with me at least once before the project is due in order to make sure that you are on track.

Important Dates:

Team formation Fri., March 8
Choose domain Tue., March 19
Submit final ontology Thr., March 28
Class presentation Thr., March 28

Team Formation and Domain Choice:

By 5pm on Friday, March 8, you need to send me an e-mail that lists your team members. By the beginning of class on Tue., March 19 you need to e-mail me a short description of your chosen application domain.

Final Ontology:

You will be graded on the breadth of coverage of the domain and completeness and accuracy of your class descriptions. I am expecting that you will describe roughly 50 to 100 classes and properties (if you import other ontologies, I expect you to create 50 to 100 new classes and properties as well). Your ontologies must be valid OWL or OWL 2 DL ontologies and should use the rich modeling constructs of OWL as much as possible. You should use a DL reasoner to ensure that your classes are satisfiable and that your ontology does not lead to unintended inferences. You should make use of rdfs:label and rdfs:comment to document your classes and properties. In addition you should create one or more files that commit to your ontology and which combined contain at least 50 instances that have 5 or more triples (triples copied from other RDF files do not count). These instances should be based on real data, but can be either entered manually or you can write a program to translate them from other formats to RDF. Where appropriate, you should include owl:sameAs statements to link your data to sources in the Linked Open Data cloud. You must have at least 20 such links. Your final ontology (or ontologies) should be in OWL RDF/XML format. Be sure to set an xml:base so that the ontologies are location independent. You should submit a ZIP file by e-mail to heflin@cse.lehigh.edu.

Class Presentation:

On Thursday, March 28, your group must provide a 12 minute presentation to the class that discusses your ontology. You will be graded on the quality of the presentation and your ability to communicate the main features of your ontology. It is recommended that you prepare a slideshow presentation.

Grading:

Your grade on the project will be composed of the following components:

Final ontology 60% Class presentation 30% Individual grade 10%

The individual grade will be based on team evaluation forms where you will be asked to evaluate the contribution of each member of your team, including yourself.
