Project #2: Term Project

This project is due on Monday, May 6. It will count for 30% of your overall grade.

Working in teams of three people each, you will extend, create or apply one or more tools for the Semantic Web. You may choose your own teams. Your team will get to propose what kind of project they want to do, but keep in mind that since you have multiple people working for over a month, it is expected that the project will be something substantial. A rough guideline is that the project should result in between 1500 and 3500 lines of your own code, although quality is more important than quantity. You are encouraged to choose projects that dovetail with your own interests and abilities.

Three kinds of projects are acceptable. The first is to design a general-purpose tool that could be used to support a major capability or need of the Semantic Web. Good examples include a tool to extract information from the Web, a more user-friendly tool to annotate pages with Semantic Web information, a reasoner, an ontology library system, or an information integration tool. The second kind of project is to extend an existing tool with an important new functionality. For example, you could create new plugins for Protégé or extend Jena with new functionality. However, keep in mind that the new functionality must result in significant new code (1500 or more lines). The third kind of project is to take existing tools and use them to develop an interesting application. In such cases the software development could involve creating a means to convert large amounts of real-world data into Semantic Web format and/or customized query interfaces. There may also be some amount of code that ties various tools together in a novel way.

Important Dates:

- Project proposal: Thr., April 4, 10:45am
- Progress report: Tue., April 23
- Presentation and demo: Thr., May 2, 12-3pm
- Final project due: Mon., May 6, 5pm

Project Proposal:
Your project proposal will serve as your project description. Therefore, it should lay out what you intend to do in as much detail as possible. You should clearly explain the intended functionality of your system. Furthermore you should provide a list of the major components and give rough estimates of the level of effort required to develop them, the programming language(s) you will use, and any supporting software you will use (e.g., Protégé, Jena, etc.). Note, you are encouraged to program in Java, however you may use other languages as long as you provide compiled versions for either the MS Windows or Solaris operating systems. You should also include a schedule that describes what you intend to accomplish each week leading up to the due date. Your proposal should be at least two pages in length, but no more than five pages (single-spaced). You will be graded on the clarity of your proposal and the quality of the idea you are proposing. After receiving your proposal, I will either e-mail or meet with your group to negotiate its scope. I will scale down projects that are too big, and scale up projects that are too small. Feel free to discuss potential ideas with me before the formal proposal.

Progress Report:
You are expected to work on the project every week from the time you turn in your proposal to the day it is due. As such, you are expected to have made significant progress by Tue., April 23. Your progress report will consist of a scheduled 30 minute meeting between your team and myself. You should bring a short written description of your progress (in particular, you should compare your progress to the original schedule from your proposal). You will be expected to give a demo that shows the current state of your system (of course, it is expected that this demo will only have limited functionality). We will also discuss
any challenges that your team has run into and potential solutions. You will be graded on the extent of your progress, although unexpected issues may serve as mitigating factors.

Presentation and Demo:
You are also required to give a presentation about your project, including a demonstration of its capabilities, to the class during our scheduled final exam period on Thursday, May 2 from 12-3pm. The demo should be thirty minutes long. You will be graded on the clarity and organization of your presentation.

Final Project:
Since the final project is due four days after your presentation, you are expected to fix any last-minute bugs and include missing features before turning it in. Your project should be submitted electronically to heflin@cse.lehigh.edu in either zip or tar.gz compressed format. The submission should include:

- source code
- compiled version of the code
- basic setup instructions
- basic user instructions
- slides from your demo presentation
- a list of modifications made since the presentation and demo

You should also turn in hardcopies of the source code and instructions. Note, the setup instructions should describe the required platform (e.g., Windows 7, Sun Solaris, etc.), programming language (e.g., Java J2SE 7.0), and any special configuration steps that are needed to run your software. You should also include URLs for any external archive/library files that are needed. The user instructions need only describe how to start your software and use its major features. If your software is reasonably intuitive, then this can be very short, hopefully one page or less.

You will be graded on the extent to which your project meets the expectations set by your proposal, the functionality of the resulting system, and its usability. The readability of your code will also play a factor in your grade.

Grading:
Your grade on the project will be based on the following components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proposal</td>
<td>10%</td>
</tr>
<tr>
<td>Progress report</td>
<td>20%</td>
</tr>
<tr>
<td>Presentation/demo</td>
<td>20%</td>
</tr>
<tr>
<td>Final project</td>
<td>40%</td>
</tr>
<tr>
<td>Individual grade</td>
<td>10%</td>
</tr>
</tbody>
</table>

The individual grade will be based on team evaluation forms where you will be asked to evaluate the contribution of each member of your team, including yourself.
